

Gemini Live Voice Usage Cost Estimate

NDIS structured onboarding voice assistant

Executive summary

The current A\$103 monthly Google Cloud bill should not be used as a fixed estimate for one normal organisation. The correct production estimate depends on total active voice hours across all organisations, providers, workers, and participants. Production may be lower, similar, or higher than A\$103 depending on adoption and real usage volume.

Cost basis

A\$0.02-A\$0.04

per active voice minute

A\$1.20-A\$2.40

per active voice hour

Key distinction

A participant who takes one week to finish onboarding does not necessarily cost more than a participant who finishes in one day. The cost depends on how many minutes they actively use the voice assistant.

Formula: Monthly Gemini Voice Cost = Total Active Voice Hours x A\$1.20 to A\$2.40

Usage Scenarios

Examples based on active voice time, not calendar completion time.

Scenario	Voice time	Cost	Notes
Fast completion	10 min	A\$0.20-A\$0.40	Minimal repeats
Typical guided completion	20 min	A\$0.40-A\$0.80	Reasonable planning case
Slower assisted completion	45 min	A\$0.90-A\$1.80	More pauses or support
Very slow / interrupted flow	90 min	A\$1.80-A\$3.60	Spread over sessions

Monthly organisation-level examples

Active voice / month	Low	High	Interpretation
25 hours	A\$30	A\$60	Light usage / early pilot
50 hours	A\$60	A\$120	Moderate usage; close to current A\$103 range
100 hours	A\$120	A\$240	Higher adoption across users
250 hours	A\$300	A\$600	Larger provider network
500 hours	A\$600	A\$1,200	High-volume rollout

Current A\$103 Bill Interpretation

Reference point from development/testing period, not a direct production benchmark.

Known development testing was approx. 16 hours

Limited internal testing sample; not representative of broad production usage.

Development differs from real usage

Testing includes repeated sessions, reconnects, debugging, and edge-case checks.

Production may involve many users

Total production cost can exceed testing if many providers and participants actively use voice.

Best estimate method

Forecast expected active voice hours per month, then update after pilot telemetry.

Recommended production forecasting method

- 1 Estimate expected monthly active voice hours.
- 2 Multiply by A\$1.20-A\$2.40 per active voice hour.
- 3 Review real usage after the first pilot month.
- 4 Replace assumptions with measured session duration and usage data.

Commercial position

A\$103 is not automatically high or low. It is not enough information by itself. The production monthly cost will depend on how many organisations use the assistant and how many total active voice hours they generate.
